Final Architecture Separates Core Extraction From Evaluation Logic

The system converts heterogeneous identity images into structured identity fields, while repeated-capture development and evaluation analyses remain separate from core inference.

CORE OCR PIPELINE

SEPARATE DEVELOPMENT AND EVALUATION LAYER

Group Aware Validation
for supervised components where applicable

Identity Linking Development Experiment
V3 Siamese linking exploration

Downstream Labeled Benchmark Analysis
LOO peer analysis using known label-derived groups

WHY THESE METRICS?

Macro Field EM
averages field-level exact match so Name, DOB, and Address contribute equally

Full Record EM
checks whether all required fields are correct together

Normalized Similarity
captures near-correct strings

Record CER
measures character-level error severity
